EXAMS

 Exam AZ-500: Microsoft Azure Security Technologies

Candidates for this exam should have subject matter expertise implementing Azure security controls that protect identity, access, data, applications, and networks in cloud and hybrid environments as part of an end-to-end infrastructure.

Responsibilities for an Azure security engineer include managing the security posture, identifying and remediating vulnerabilities, performing threat modeling, implementing threat protection, and responding to security incident escalations.

Azure security engineers often serve as part of a larger team to plan and implement cloud-based management and security.

Candidates for this exam should have practical experience in administration of Azure and hybrid environments. Candidates should have experience with infrastructure as code, security operations processes, cloud capabilities, and Azure services.

You may be eligible for ACE college credit if you pass this certification exam. See [ACE college credit for certification exams](#) for details.

Important

Azure security engineers often serve as part of a larger team to plan and implement cloud-based management and security.

Candidates for this exam should have practical experience in administration of Azure and hybrid environments. Candidates should have experience with infrastructure as code, security operations processes, cloud capabilities, and Azure services.

You may be eligible for ACE college credit if you pass this certification exam. See [ACE college credit for certification exams](#) for details.

 **Important**

The English language version of this exam was updated on August 2, 2022. Please download the study guide listed in the "Tip" box to see the current skills measured. If a localized version of this exam is available, it will be updated approximately eight weeks after this date.

Passing score: 700. [Learn more about exam scores](#).

Day 1

Microsoft Azure Security Technologies Bootcamp

- Manage identity and access (30-35%)
- Implement platform protection (15-20%)

Manage Identity and Access (30–35%)

- Manage Azure Active Directory (Azure AD) identities
- Manage secure access by using Azure AD
- Manage application access
- Manage access control

Manage Azure Active Directory (Azure AD) Identities

- Create and manage a managed identity for Azure resources
- Manage Azure AD groups
- Manage Azure AD users
- Manage external identities by using Azure AD
- Manage administrative units

Frequently asked questions

Known issues

Azure services that support managed identities for Azure resources

Azure services that support Azure Active Directory authentication

Stack Overflow

Azure AD Developers forum

Azure services that can use managed identities to access other services

Article • 08/17/2022 • 3 minutes to read • 15 contributors

Managed identities for Azure resources provide Azure services with an automatically managed identity in Azure Active Directory. Using a managed identity, you can authenticate to any [service that supports Azure AD authentication](#) without managing credentials. We are integrating managed identities for Azure resources and Azure AD authentication across Azure. This page provides links to services' content that can use managed identities to access other Azure resources. Each entry in the table includes a link to service documentation discussing managed identities.

Important

New technical content is added daily. This list does not include every article that talks about managed identities. Please refer to each service's content set for details on their managed identities support. Resource provider namespace information is available in the article titled [Resource providers for Azure services](#).

The following Azure services support managed identities for Azure resources:

Service Name	Documentation
API Management	Use managed identities in Azure API Management
Application Gateway	TLS termination with Key Vault certificates

Manage your privileged access

Use Privileged Identity Management to manage the lifecycle of role assignments, enforce just-in-time access policy, and discover who has what roles. [Learn more](#) ↗

Manage access

Users with excessive access are vulnerable in the event of account compromise. Ensure your organization manages to least privilege by periodically reviewing, renewing, or extending access to resources.

Activate just in time

Reduce the potential for lateral movement in the event of account compromise by eliminating persistent access to privileged roles and resources. Enforce just in time access to critical roles with PIM.

Discover and monitor

It is common for access to critical resources to go undetected. Ensure you know who has access to what, and receive notifications when new assignments are granted to accounts in your organization.

Implement Platform Protection (15–20%)

- Implement advanced network security
- Configure advanced security for compute

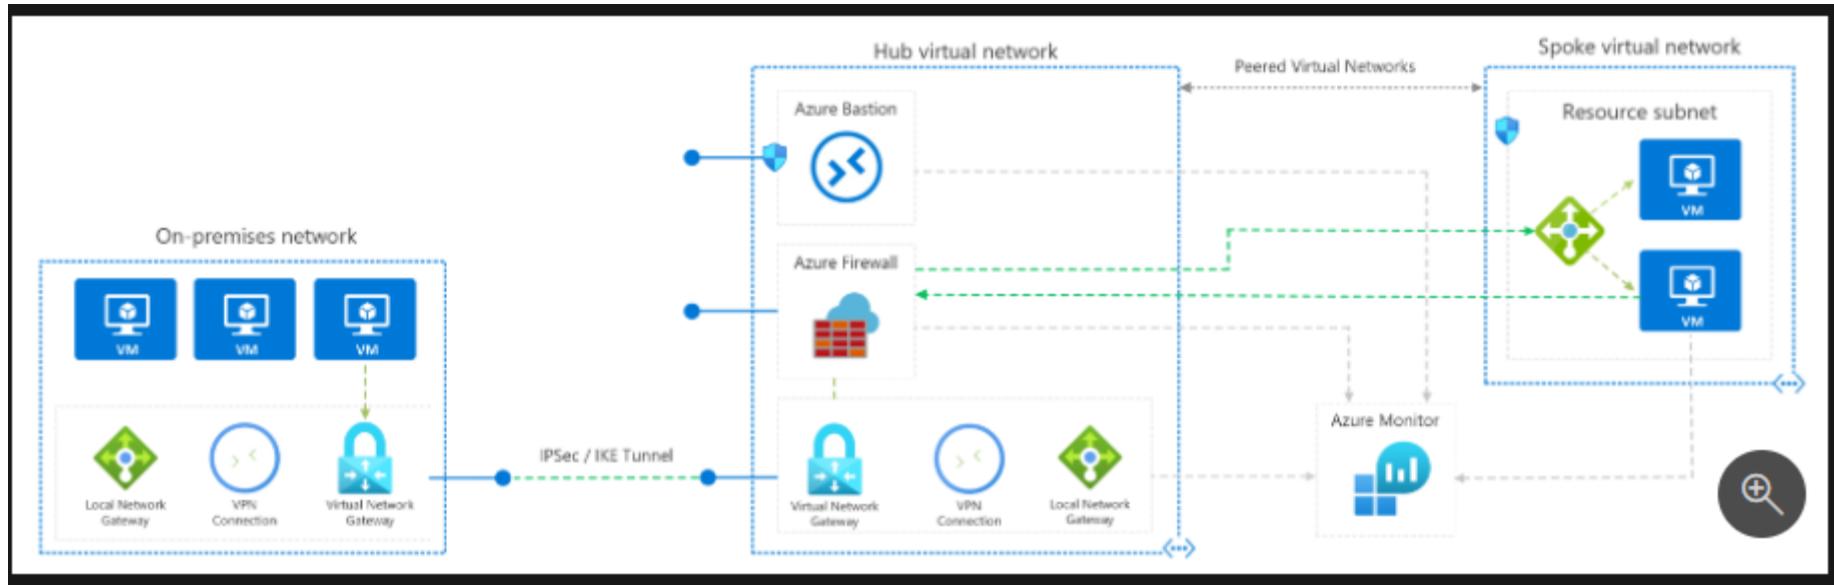

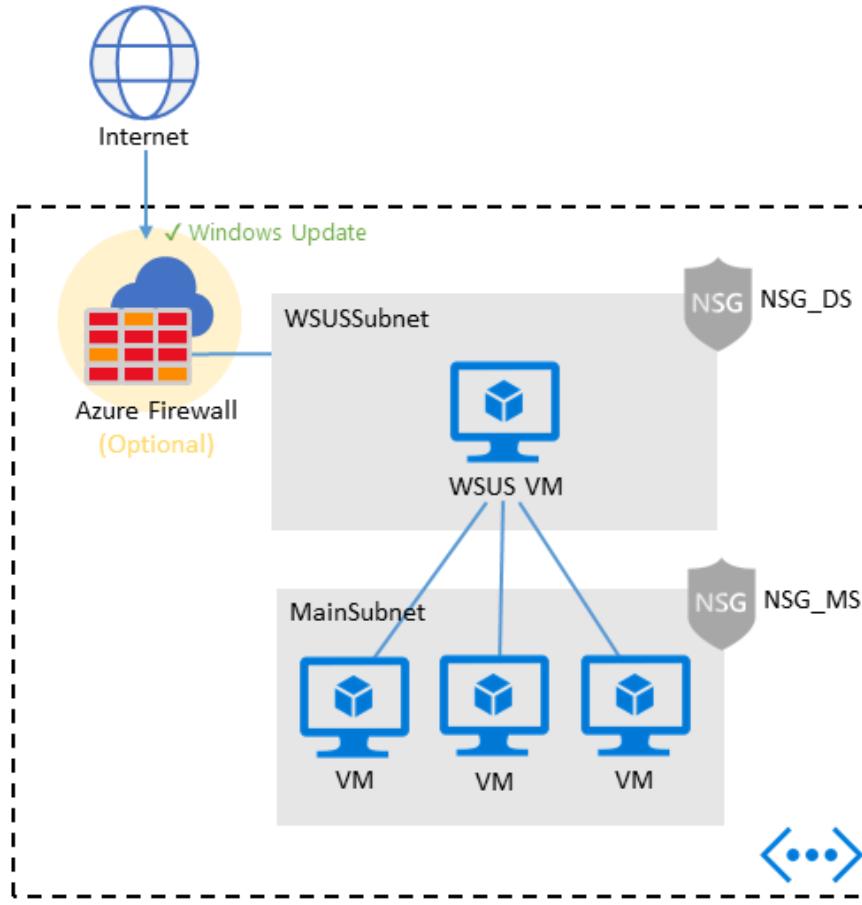

Implement Advanced Network Security

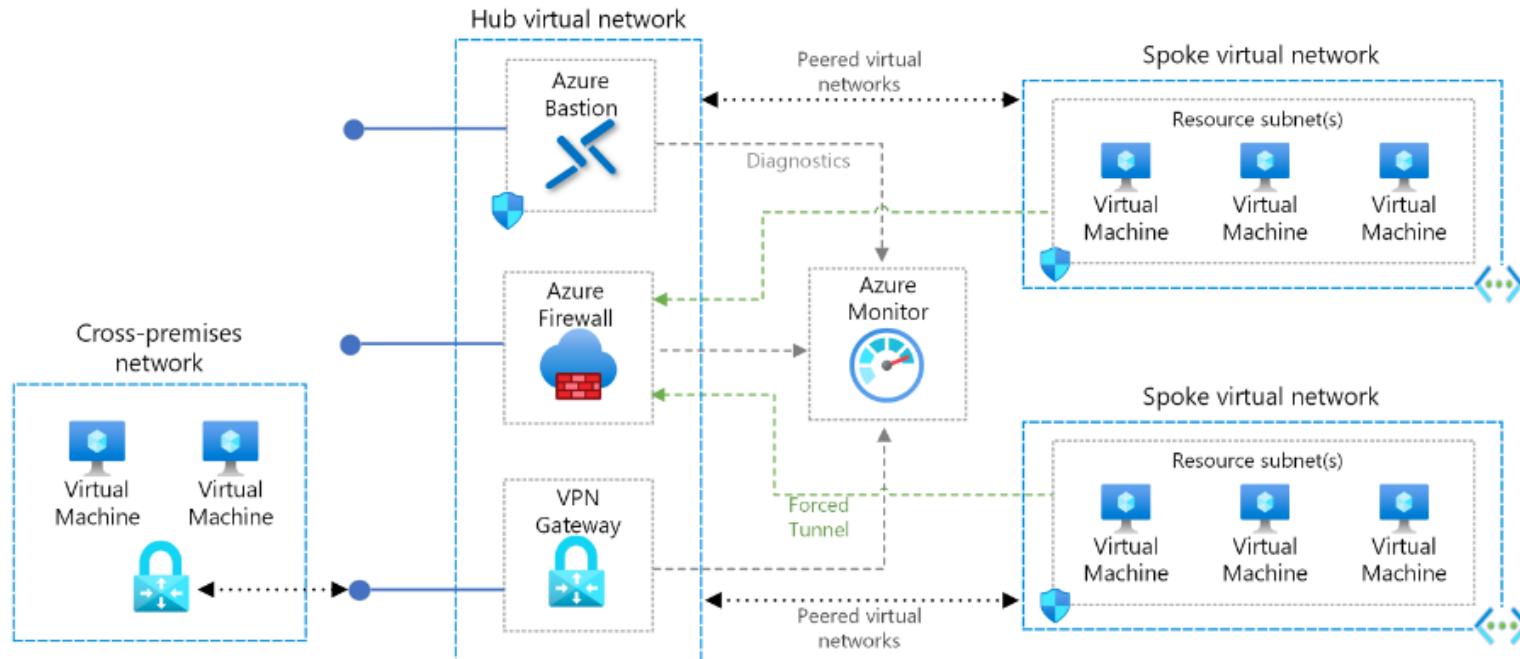

- Secure the connectivity of hybrid networks
- Secure the connectivity of virtual networks
- Create and configure Azure Firewall
- Create and configure Azure Firewall Manager
- Create and configure Azure Application Gateway
- Create and configure Azure Front Door
- Create and configure Web Application Firewall (WAF)
- Configure a resource firewall, including storage account, Azure SQL, Azure Key Vault, or Azure App Service
- Configure network isolation for Web Apps and Azure Functions
- Implement Azure Service Endpoints
- Implement Azure Private Endpoints, including integrating with other services
- Implement Azure Private Links
- Implement Azure DDoS Protection

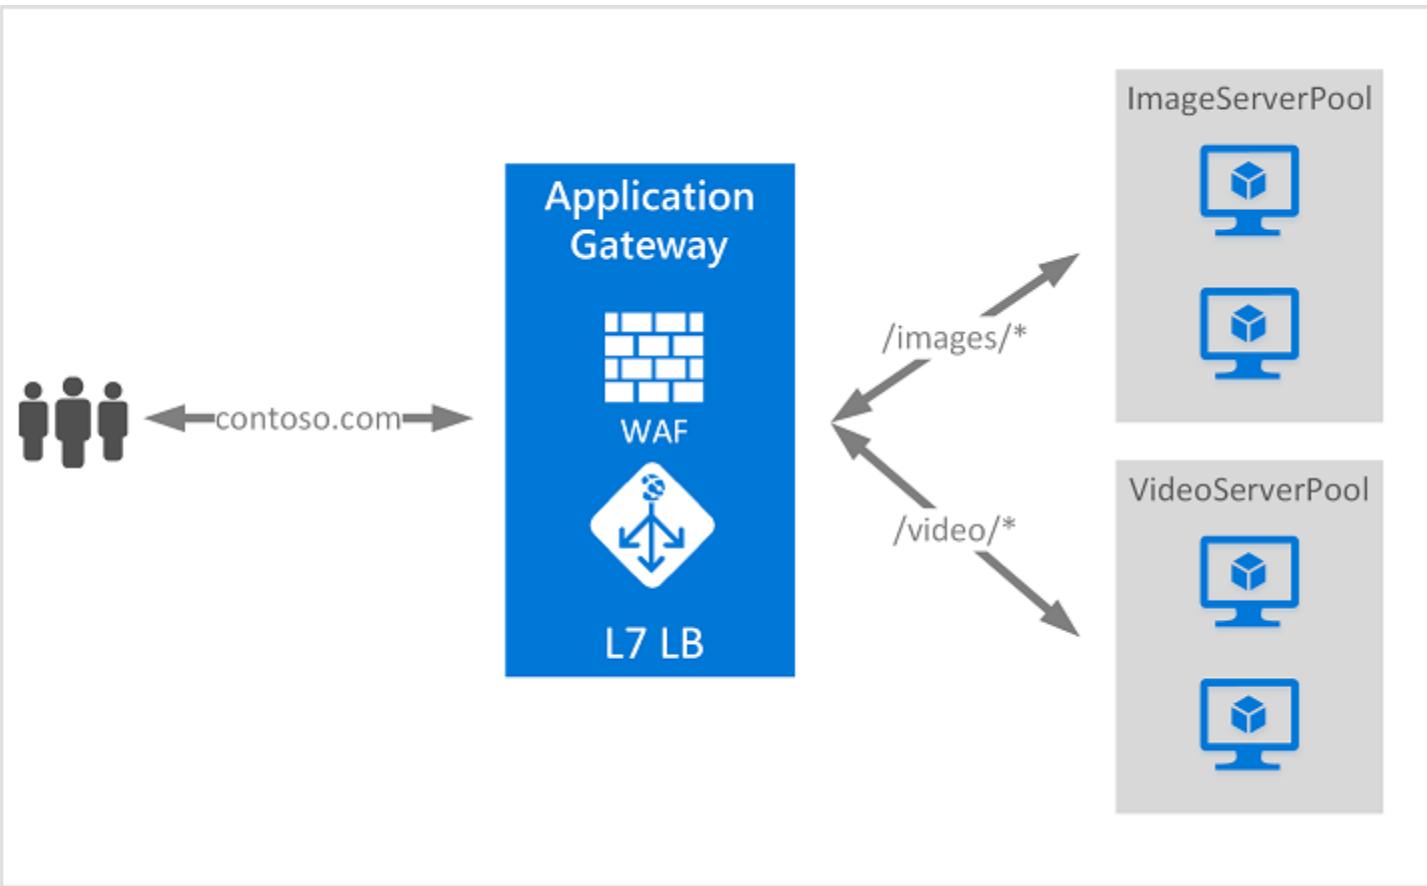

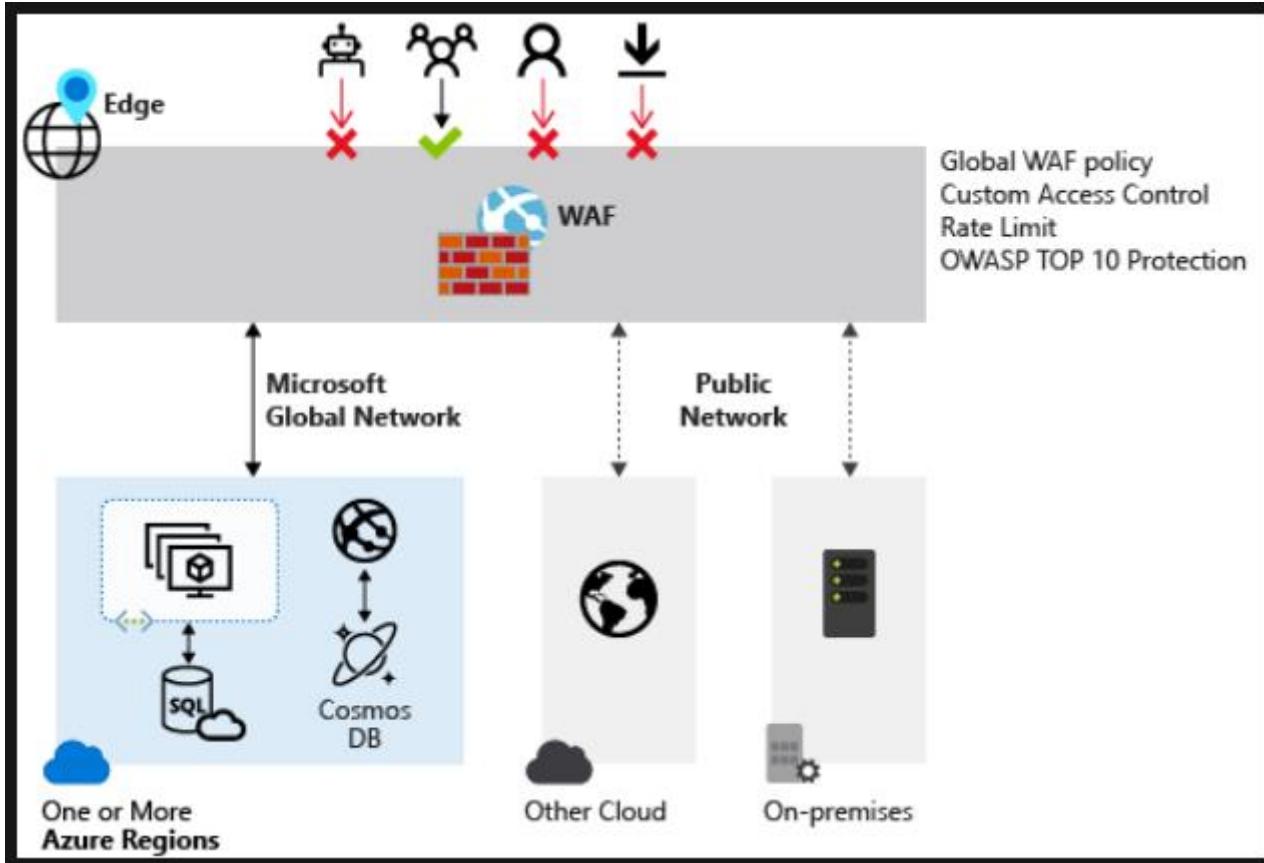

Hybrid Network

 **Note**

Microsoft recommends use of Azure Private Link for secure and private access to services hosted on Azure platform. For more information, see [Azure Private Link](#).

Configure Advanced Security for Compute

- Configure Endpoint Protection for virtual machines (VMs)
- Implement and manage security updates for VMs
- Configure security for container services
- Manage access to Azure Container Registry
- Configure security for serverless compute
- Configure security for an Azure App Service
- Configure encryption at rest
- Configure encryption in transit

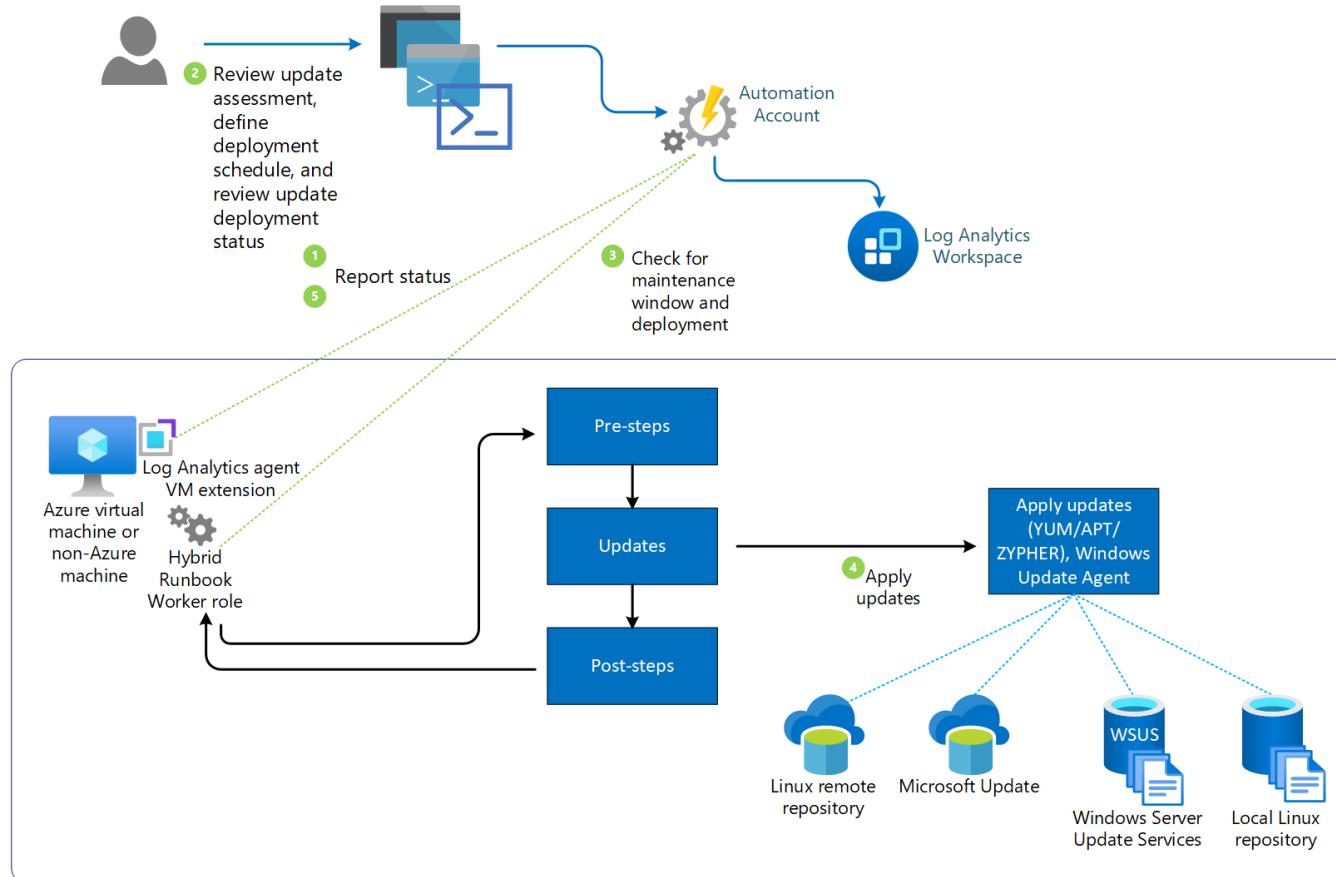

Configure Endpoint Protection for Azure VMs

- Windows Defender
- Microsoft System Center endpoint protection
- Trend Micro
- Symantec endpoint protection
- McAfee endpoint protection for Windows
- McAfee Endpoint Security for Linux Threat Prevention
- Sophos Antivirus for Linux

Configure Security for Container Services

- Security considerations for Azure Container Instances
- Overview of Microsoft Defender for Containers
- Azure security baseline for Container Instances
- Security concepts for applications and clusters in Azure Kubernetes Service (AKS)
- Authentication and authorization in Azure Container Apps

Manage Access to Azure Container Registry

- Authenticate with an Azure container registry
- Azure Container Registry roles and permissions

Configure Security for Serverless Compute

- Secure access and data in Azure Logic Apps
- Secure Azure Functions

Configure Security for an Azure App Service

- Security in Azure App Service
- Security recommendations for App Service
- Azure security baseline for App Service

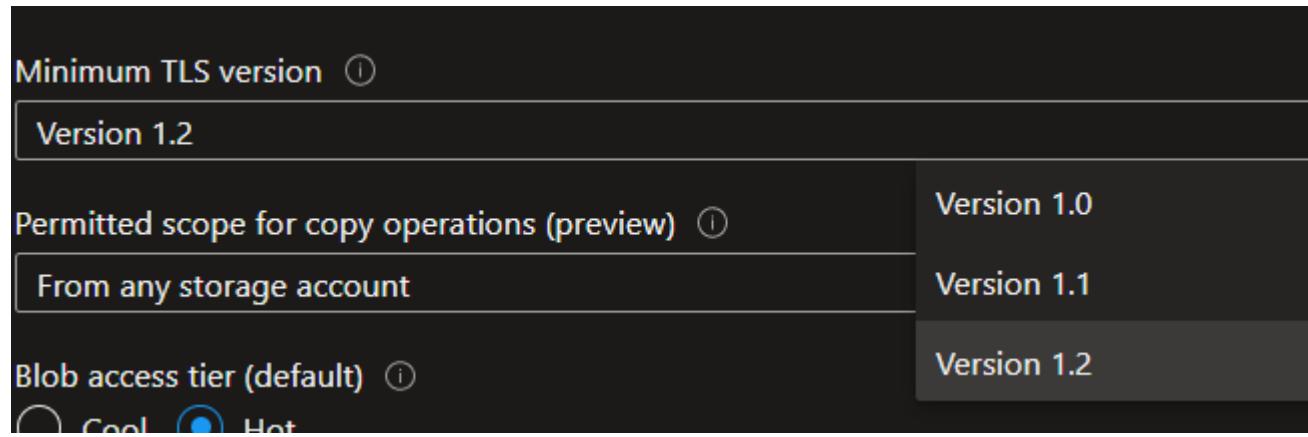

Configure Encryption at Rest

- Azure Data Encryption at rest
- Azure Storage encryption for data at rest
- Data encryption in Azure Cosmos DB

Configure Encryption in Transit

- Encryption of data in transit

Day 2

Microsoft Azure Security Technologies Bootcamp

- Manage security operations (25–30%)
- Secure data and applications (25–30%)

Manage Security Operations (25–30%)

- Configure centralized policy management
- Configure and manage threat protection
- Configure and manage security monitoring solutions

Configure Centralized Policy Management

- Configure a custom security policy
- Create a policy initiative
- Configure security settings and auditing by using Azure Policy

Azure Built-in Policy Definitions

- Azure Policy built-in policy definitions

Secure Data and Applications (25–30%)

- Configure security for storage
- Configure security for data
- Configure and manage Azure Key Vault

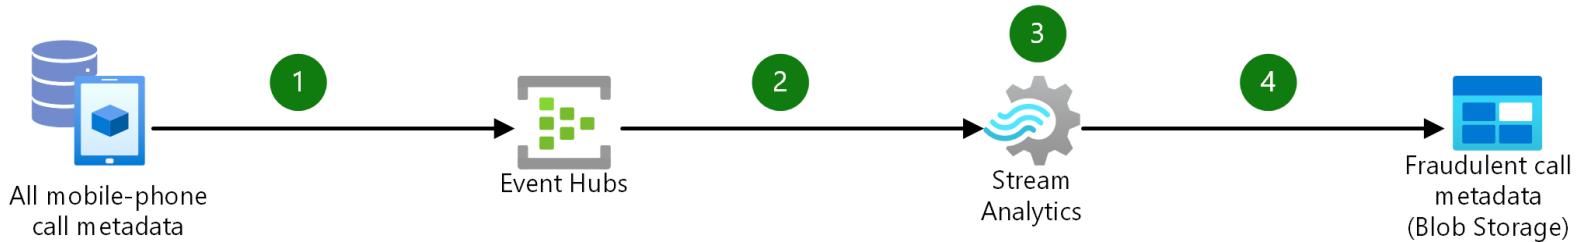

Configure Security for Storage

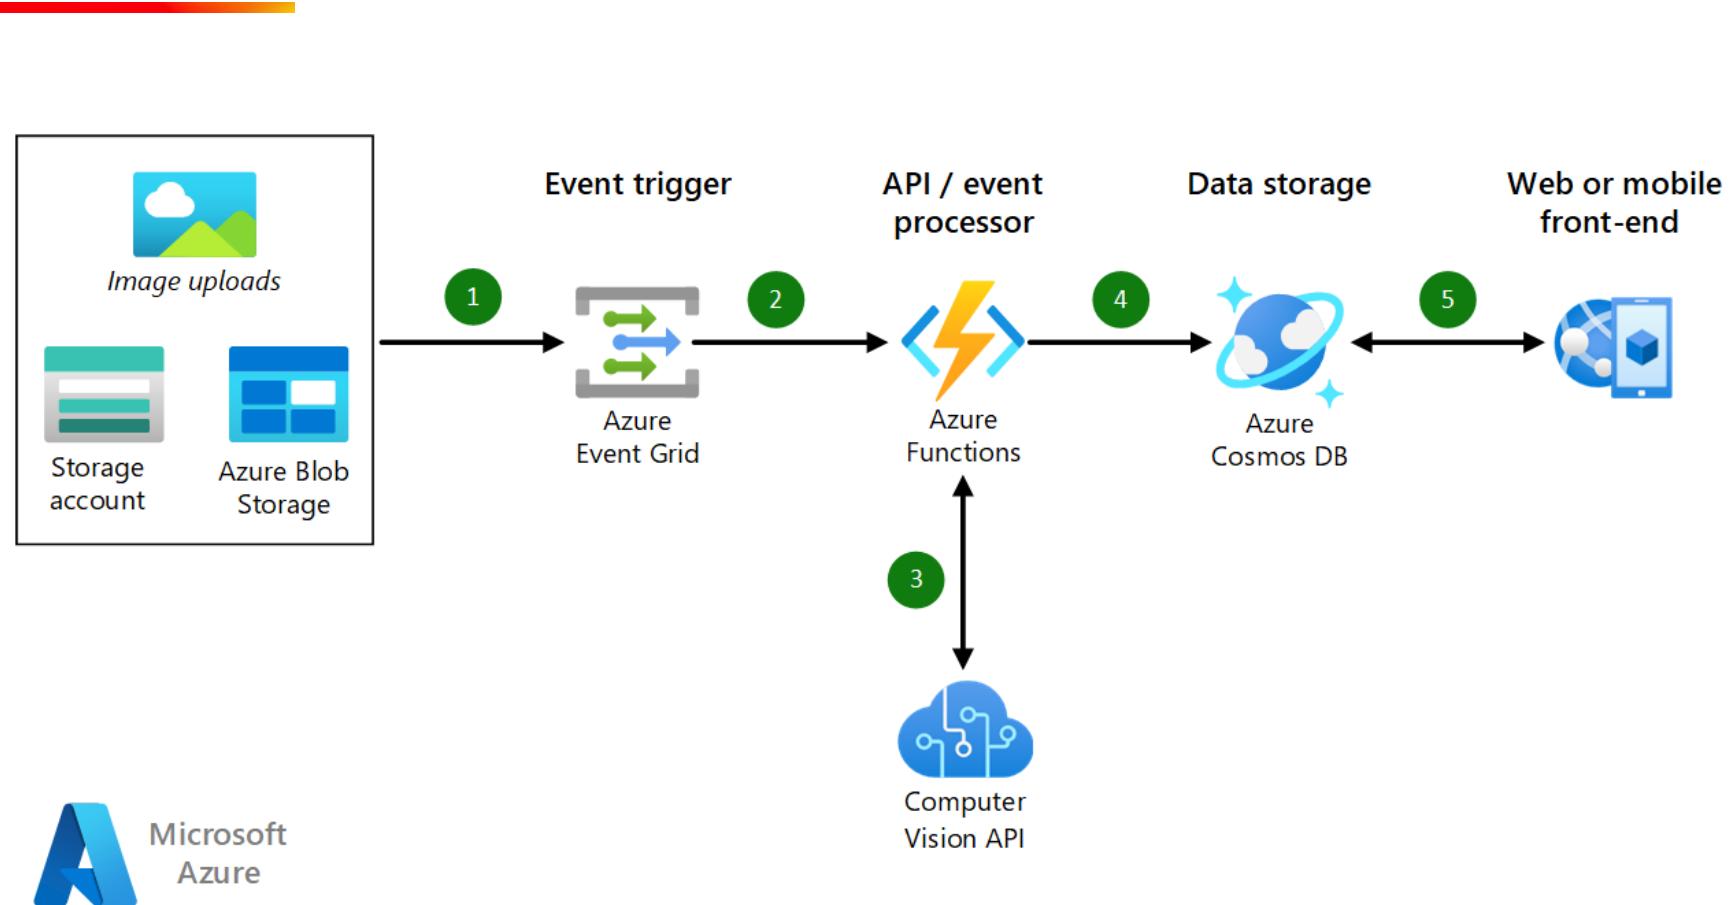

- Configure access control for storage accounts
- Configure storage account access keys
- Configure Azure AD authentication for Azure Blobs and Azure Files
- Configure delegated access (and see this)

Azure artifact	Shared Key (storage account key)	Shared access signature (SAS)	Azure Active Directory (Azure AD)	On-premises Active Directory Domain Services	Anonymous public read access	Storage Local Users
Azure Blobs	Supported	Supported	Supported	Not supported	Supported	Supported, only for SFTP
Azure Files (SMB)	Supported	Not supported	Supported, only with AAD Domain Services	Supported, credentials must be synced to Azure AD	Not supported	Supported
Azure Files (REST)	Supported	Supported	Not supported	Not supported	Not supported	Not supported
Azure Queues	Supported	Supported	Supported	Not Supported	Not supported	Not supported
Azure Tables	Supported	Supported	Supported	Not supported	Not supported	Not supported

24a | Shared access signature

A shared access signature (SAS) is a URI that grants restricted access rights to Azure Storage resources. You can provide a shared access signature to clients who should not be trusted with your storage account key but whom you wish to delegate access to certain storage account resources. By distributing a shared access signature URI to these clients, you grant them access to a resource for a specified period of time.

An account-level SAS can delegate access to multiple storage services (i.e. blob, file, queue, table). Note that stored access policies are currently not supported for an account-level SAS.

Create a key vault

...

Basics Access policy Networking Tags Review + create

Azure Key Vault is a cloud service used to manage keys, secrets, and certificates. Key Vault eliminates the need for developers to store security information in their code. It allows you to centralize the storage of your application secrets which greatly reduces the chances that secrets may be leaked. Key Vault also allows you to securely store secrets and keys backed by Hardware Security Modules or HSMs. The HSMs used are Federal Information Processing Standards (FIPS) 140-2 Level 2 validated. In addition, key vault provides logs of all access and usage attempts of your secrets so you have a complete audit trail for compliance.

System Test

I confirm that on my exam day I will be using this same testing space, computer, and internet connection.

Alert! Work computers generally have more restrictions that may prevent a successful test. Ensure you are not behind a corporate firewall, and shut down any **Virtual Private Networks (VPNs)** or **Virtual Machines**.

1. Copy Access Code

Click '**Copy Access Code**'.

This code will authorize you to perform a system test.

690-635-235

Copy Access Code

2. Download OnVUE

Click '**Download**'.

Download

3. Run OnVUE

Run the OnVUE application from your Downloads folder.
